

Ultrasonography is a famous method used on almost every level in terms of human skin analysis. Starting with pregnancy, through skin disorders and ending with analyzing of general skin appearance, USG is a powerful technique that, along with skin structure knowledge and experience, provides tons of essential medical and cosmetic data. Concerning the cosmetic data – a lot of the companies are mainly focused on their product's anti-wrinkle and filling effects which are strictly connected with collagen fibre content. That is why it is crucial to have an appropriate methodology that will help everyone in the industry to substantiate their claims about skin density.

SKIN IMAGING USING ULTRASONOGRAPHY

Applied for:

- Skin care products with anti-ageing action:
Cream, Serum, Face mask.
- Others (feasibility discussed with the Laboratory)

Claim:

- The product improves the skin density by an increase in collagen content.

Probes available:

- 22 MHz
- 75 MHz
